FITTING FORK BRACE ASSY (92637)

To allow the forks to align themselves, loosen the wheel nuts and clamp stud nuts.

Assemble the fork brace brackets loosely around each fork leg.

We would advise applying a bead of silicone sealant between the clamp halves to prevent the ingress of dirt into seal area.

Fit the bridge and lightly nip-up the bolts of the bridge and clamps.

Bounce the forks a few times to centre and settle them.

Then tighten all the allen bolts of the brace firmly - but DO NOT over-tighten.

Finally, tighten the wheel retaining fixings to the correct torque [48 lb/ft for the wheel nuts, and about 14 lb/ft for the clamp nuts].
