Crash Bars, Part Numbers.: 200023 & 200023ES

Fitting Instructions:

Loosely fix the top clamp around the frame front down tube, just above the height of the top of the exhaust pipe. The lower bracket should mount to the middle 8mm stud on the front engine plate.

On Electric start models this lower fixing has a bolt fitted as standard. Sometimes this bolt is fitted with the head on the left hand side. The primary chaincase/electric start housing will prevent removal of this bolt. If this is the case, rather than strip the chaincase down, you can carefully hacksaw the head off, after you have loosened the nut on the opposite side. Replace this with the enclosed stud, nuts and washers.

Check that the crash bars clear the exhaust, indicators and front mudguard on both the left and right hand lock before tightening all the fixing nuts.
